Agenda

- Introduction to Maintenance Scheduling
- Architecture of a Scheduling System
- Possible Contributions to Operation Research

Mathematical Notation: Sets

$a \in A^{m}_{b,c}(t, x, y)$

- a: set element
- A: set itself
- b: set element from set B
- c: set element from set C
- m: model formulation m
- t: time
- x: value of decision variable from a different model
- y: value of decision variable from a different model

Mathematical Notation: Parameters

$name\_of\_parameter_{a,b}(t, x, y)$

- parameters are functions of set elements and input parameters
- a: set element from A
- b: set element from B
- t: time
- x: value of decision variable from another model
- y: value of decision variable from another model

Mathematical Notation: Variables

$x^m_{a,b}(t)$

- variables are functions of set elements, specified model, and time
- x: decision variable
- a: set element from A
- b: set element from B
- m: specifying the model
- t: time
- Notice: decision variables cannot depend on other decision variables as it would make them belong to the same model.

Strategic

Meta variables:

$$s \in S \quad (1)$$

$$\beta(\tau) \quad (2)$$

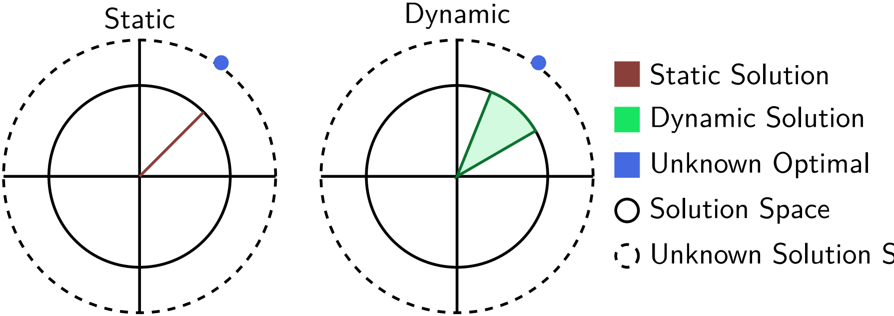
Dynamic versus Static Models



- Mathematical models guide direction but does not provide direct solutions.
- Static solutions are rarely fully executable.
- Dynamic models are less constrained and ensure a contained optimal solution.
- Remember: The real optimal solution is ever knowable at time $= 0$
